T-17 Rapid Patch
MMA POLYMER CONCRETE

Extends Life of Concrete Structure
Transpo’s T-17 methyl methacrylate polymer concrete is a 100% reactive, pre-packaged, two component solvent-free material system. T-17 is designed for use on new construction and rehabilitation of bridge decks, expansion joints, bearing pads, airport runways and other concrete structures.

Designed for new construction as well as rehabilitation, it is easy to handle in all working conditions, and requires no special equipment.

T-17 cures in less than one hour, unlike cementitous based materials. T-17’s rapid curing time assures a quick return to service.

Partial or full depth applications can be accomplished in a single pour restoring the integrity of deteriorated PCC structures.

T-17 Rapid Patch
MMA POLYMER CONCRETE

Features and Advantages
- Wide Application Temperature Range: 14 - 100°F (-10 - 38 °C)
- Fast Setting: 45 min. at 70°F (21 °C) or 90 min. at 14°F (-10°C)
- High Early Strength
- Strong Chemical Bond (no cold joints)
- Chemical Resistant
- UV Light Resistant
- Freeze-Thaw Resistant
- Waterproof
- Easy to Use

Application Process
Transpo’s T-17 can be used as a neat mortar for grouting or thin patches (1/2” deep maximum). It can also be filled with special aggregate and used for partial or full-depth patching in a single pour for most applications. This system is to be used on horizontal concrete surfaces, on grade, above and below grade, and can be pumped.

A thin coat of T-41s methyl methacrylate primer should be used to seal the existing concrete surface and increase the bond strength of cured T-17 to the portland cement concrete (PCC).

Applications
Because of its high strength, chemical resistance, and rapid cure, T-17 can be used for repairs and rehabilitation of numerous concrete structures including:
- Concrete Bridge and Parking Deck Repair
- Concrete Spall Repair
- Structural Grouting
- Expansion Joint Headers
- Structural Bearing Pads
- Load Transfer Devices
- Concrete Runway Repair
